TITLE: Elementary model of the vestibular apparatus

SOURCE: AN SSSR. Otdeleniye biologicheskikh nauk. Problemy kosmicheskoy biologii, v. 4, 1965, 543-554

TOPIC TAGS: spacecraft capsule, human sense, audition, acceleration, central nervous system, neuron, space medicine equipment

ABSTRACT: The vestibular analyzer plays an important role in spatial orientation and can be schematically divided into two sections; receptors which perceive the physical factor, and the central section which coordinates receptor information with various nervous-system formations. The purpose of this investigation was to develop an elementary model of the vestibular apparatus in the interest of elucidating some functional features of this organ under conditions of a variable gravitational field.

1. Characteristics of receptors of the otolithic section of the vestibular apparatus

Card 1/12

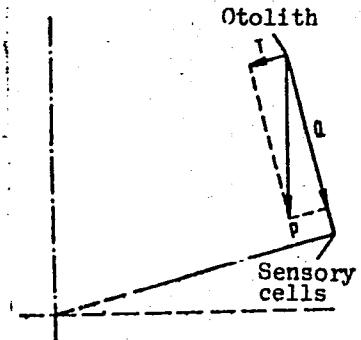

Fig. 1. Principles of a receptor

P - weight of otolith, Q - weight force directed along the afferent fiber, T - force component acting across the afferent fiber.

Figure 1 schematically represents the function of otolithic receptors.

The hypothesis is presented that the receptor reacts to the angle of head inclination relative to the vertical axis when changes in the magnitude of weight component forces of the otolith take place along or across an afferent fiber. The transformers of these changes in magnitude into impulse frequencies are sensory cells. Thus, the receptor will react both to the angle of head inclination and to acceleration forces which take place when the organ

O

ism is moving as a function of changes in otolithic weight. It has been shown that the frequency of sensory impulses increases proportionately with acceleration.

2. Reactions of receptor-neuron systems to acceleration gradually changing with time

Some results of an investigation of the rhythmic activity of 100 neurons in the giant cell nucleus of the reticular formation of a cat during 5-G acceleration are given in the following figures, along with graphic representations of neuronal processes which arise under these conditions.

Figures 4 and 5 are mathematical derivations of the experimental results. It can be seen that the aggregate curve of neuron impulse frequency is sufficiently close to the experimental curve shown in figure 3.

3. Reaction of a receptor-neuron system to acceleration periodically changing with time

Card 10/12

L 14301-66
ACC NR: AT6003890

The problem of the dynamic nature of "channels" of the otolithic portion of the vestibular analyzer is discussed. It is proposed that a model of a so-called receptor-neuron channel would be a circuit with constant resistance (R), inductance (L), and capacitance (C), successively switched on. The acceleration acting on the organism is likened to the circuit voltage, and the current is analogous to the electrical activity of a receptor-neuron system. Experimental data supported the feasibility of the model shown above.

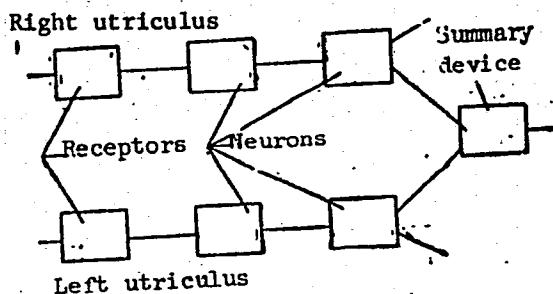

Fig. 10 Principle of the "Summator"

Card 11/12

L 14301-66

ACC NR: AT6003890

Figure 7 shows the modeled effects of prolonged otolithic stimulation.

4. Some principles of the so-called "summing device"

A diagrammatic representation of the so-called summing device which compares the coupled signals from the left and right utriculus and the saccus is given in Figs. 8, 9, and 10.

The author states that the summing device, working according to the proposed systems, excellently reflects the features of the movements of birds and animals with removed right and left otoliths.

It is concluded that the proposed principles of modeling the otolithic portion of the vestibular apparatus can be used to explain some general features of this important organ. It is hoped that further development in this field will lead to the creation of a much-needed electronic model for more detailed investigations of vestibular function. TITLE: Bioelectric reactions and oxygen tension in several parts of the brain during hypoxic hypoxia [Paper presented at the Conference on Problems of Space Medicine hold in Moscow from 24 to 27 May 1966.]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 111-112

TOPIC TAGS: hypoxia, electroencephalography, central nervous system

ABSTRACT: The sequence, functional significance, and physiological mechanisms of phase changes in the EEG's of various parts of the brain during hypoxic hypoxia were studied in rabbits with electrodes implanted in the sensorimotor region of the cortex, the hippocampus, the posterior hypothalamus, and the midbrain reticular formation. The rabbits breathed nitrogen through a mask. Functional state of these centers was evaluated by assimilation of rhythmic light flashes on the EEG. In 6 animals pO₂ in the cortex and reticular formation was polarographically recorded. As hypoxic hypoxia developed,

Card 1/2

ACC NR: AT6036526

the well-known 3 characteristic phases of EEG changes appeared: 1) the arousal reaction phase; 2) the dominant slow wave phase; and 3) the phase of electrical activity extinction. It was found, however, that the phase 2 slow waves alternated with periods of rapid oscillations, and that recurrent slow waves could be observed in the activity extinction phase in addition to periods of bioelectric "silence". During the first (amplitude gain) stage of the slow wave phase EEG's of all studied brain structures showed assimilation of light flash rhythms. Simultaneous decrease in pO₂ shows this to be a persistence reaction masking the development of CNS inhibition. Restoration of the light flash rhythm assimilation following hypoxic hypoxia usually occurred first in the cerebral cortex.

Changes in cerebral cortex and reticular formation EEG's during hypoxic hypoxia were correlated and analyzed by computer, and the results compared with changes in pO₂ in the cortex (59.25 ± 10.25 from initial levels) and reticular formation ($79.75 \pm 3.33\%$ from initial levels). W. A. No. 22;

TOPIC TAGS: neuron, vestibular function, electromagnetic biologic effect, information coding evaluation

ABSTRACT: The results are reported of an experimental study of information coding in some regions of the central nervous system of animals whose organism was subjected to overloads. Activity of the neurons of a giant-cell nucleus of reticular formation was studied; in practice, the activity of a chain comprising a receptor and a few series-connected neurons was observed. A cat was rotated in a centrifuge

Card 1/2

ACC NR: AT7004920

which created a 5-times-normal load in his organism. Pulses of 100 neurons were measured before, during, and after the overload. An inference can be drawn that the receptors of the otolith part of the vestibular apparatus generate electrical pulses of 1-2 msec duration, 1-5 mv height, at a frequency from a fraction of cps to 30 cps. With application of an overload, the frequency increases to 120-130 cps, pulse height remaining constant. It is found that: (1) The output of the receptor-neurons chain is a function of two parameters: degree of overload and time; (2) With gravity variation of 1:4000, the output-frequency limit is 150 cps. Title : Homemade Preserves as a Source of Botulism

Orig Pub : V sb.: Anaerobnyye infektsii. Kiyev, Gosmedizdat USSR,
1957, 145-147

Abstract : Three cases of poisoning are described in individuals with clinical symptoms of botulism after having partaken of homemade preserves prepared from pork which had been sealed under antiseptic conditions. The meat was boiled with the seasonings, cut into small pieces, and placed in a jar along with tomatoes, and pork fat was poured over the top. The unsanitary part of the procedure involving the carcass of the pig could have favored its contamination with spores of the *botulinus bacillus*, and the sealing with

An investigation of the parametric oscillations of a circular conical shell supported at one end and loaded with uniform transverse pressure.

It is assumed that with this attachment the mean surface is deformed without elongation or shearing. From this the kinetic energy of the system, the internal potential energy, and the potential of the external forces are determined. The Lagrange equation which describes the dynamic process, after certain transformations, is reduced to a familiar differential equation of the Mathieu type. The boundaries of the first and second critical regions of dynamic instability are indicated. For envelopes having a conicity of $2\alpha = 12^\circ$, $2\alpha = 18^\circ$ at a pressure of $P \neq 0$, the theoretical results are compared with those of the experiment. The extent of applicability of the solution is not explained. In view of the assumption of the nonelongation of the mean surface in the general case, i.e. at $P \neq 0$, the solution is correct only for long shells.

PURPOSE: This Booklet was written to arouse public interest and
pride in the sputniks.

COVERAGE: The booklet discusses what sputnik projects exist at the
present time, how the sputniks will be orbited, and what
scientific information can be furnished by the instruments
they carry. The 15 figures show: the structure of the
atmosphere and temperature variations with altitude (fig.1);
results of photographic surveys of the earth's surface
obtained by high-altitude rocket (fig.2); a "V-2" rocket
on its launching platform (fig.3); a "Bumper" rocket in
flight, with the first-stage motor working (fig.4); the
Card 1/2 orbits of the Moon and of an artificial satellite (fig.5);

RAZUMIKHIN, B.S.

SUBJECT USSR/MATHEMATICS/Differential equations CARD 1/1 PG - 1/2
 AUTHOR RAZUMICHIN B.S.
 TITLE On the stability of the trivial solution of a system of second
 order.
 PERIODICAL Priklad. Mat. Mech. 19, 279-286 (1955)
 reviewed 7/1956

By aid of the direct Liapunov method the author investigates the stability of the trivial solution of non-linear systems of second order which can be brought to one of the following forms or similar ones:

$$\begin{cases} \dot{x} = p_1(x,y)x + p_2(x,y)y \\ \dot{y} = x \end{cases} \quad \begin{cases} \dot{x} = p_1(x,y)x + p_2(x,y)y \\ \dot{y} = x \pm y \end{cases} .$$

As Liapunov function a positive definite quadratic form

$$V = \alpha x^2 + 2\beta xy + \gamma y^2$$

is used. The regions of stability result from the postulate that $\frac{dV}{dt}$ is negative definite or semi-definite, and they are bounded by certain parabolas which can be constructed easily. The method is applicable only under certain restrictions on the coefficients p_i ; in the first case e.g. $p_1(x,y)$ and $p_2(x,y)$ must be bounded and negative for all values x,y .

reviewed 11/1956

CARD 1/3

The author investigates the asymptotic stability of the trivial solution of the system

$$(1) \quad \frac{dx_i}{dt} = x_i(t)x_j(t), x_{jk}(t-\tau))$$

where x_i is a continuous function which is bounded in the region $t \geq t_0$, $|x_j| \leq H = \text{const}$, which depends on the time, the coordinates and on the $m \cdot n$ functions $x_{jk}(t-\tau)$ and which vanishes for $x_j(t) = 0$. Here X depends on the values of the functions $x_{jk}(t-\tau)$ on the interval $0 \leq \tau \leq h_{ij}(t) \leq h$.

The extension of the direct Liapunov method to the stability examination of the systems with retardation was given by Krasovski (Priklad. Mat. Mech. 20, 315-327 (1956)) who therefore has introduced the notion of the positive definite functional. The effective construction of the functionals with the properties of Liapunov functions involves great difficulties until now. Therefore the author investigates the question how far the stability examination

Priklad. Mat. Mech. 20₁ 500-512 (1956)

CARD 2/3 PG 370

of (1) can be made by aid of ordinary Liapunov functions. Since the latter obviously represent special cases of a definite functional, the theorems of Krasovski can be applied. But it proves that there are extraordinary hard sufficient conditions, e.g. there exists no Liapunov function which, for an equation of first order, can be used in the case of an oscillating asymptotic stability. Therefore the practical importance of the investigation will be insignificant. Nevertheless it seems to be interesting that at least theoretical the Liapunov criterion becomes more and more the most universal method for the stability examination.

The author formulates and proves several criteria of stability, e.g.: If there exists a positive definite function $V(t; x_1, \dots, x_n)$ the derivative of which

$$\frac{dV}{dt} = \sum_{i=1}^n \frac{\partial V}{\partial x_i} \cdot \frac{dx_i}{dt} + \frac{\partial V}{\partial t} - \sum_{i=1}^n \frac{\partial V}{\partial x_i} x_i + \frac{\partial V}{\partial t} = U(t; x_j(t), x_{jk}(t-\tau))$$

has the property that the functional $U(\delta, y_j(\delta), y_{jk}(\delta-\tau))$ along every curve L is negative or identical equal zero, then the trivial solution of (1) is stable. Here L is a curve $y_1(\delta), \dots, y_n(\delta)$ which for $t > t_0$ satisfies the conditions

RAZUMICHIN, B.S.

SUBJECT USSR/MATHEMATICS/Differential equations CARD 1/1 PG - 393
 AUTHOR RAZUMICHIN B.S.
 TITLE On the stability of nonsteady motions.
 PERIODICAL Priklad. Mat. Mech. 20, 266-270 (1956)
 reviewed 11/1956

Let the system

$$\frac{dx_i}{dt} = \sum_{j=1}^n p_{ij}(t) x_j \quad (i=1, \dots, n)$$

be given. Let the coefficients $p_{ij}(t)$ be bounded together with their first derivatives. The system with constant coefficients

$$\frac{dx_i}{dt} = \sum_{j=1}^n p_{ij}(\kappa) x_j \quad (i=1, \dots, n)$$

is assumed to satisfy the conditions of the asymptotic stability for all positive values of the parameter κ . The roots of the equation $\det_n \| p_{ij}(\kappa) - \delta_{ij}\lambda \| = 0$ satisfy the condition $\operatorname{Re} \lambda_i(\kappa) < -\delta < 0$, where

δ is an arbitrarily small fixed positive number.
 By a generalization of Cetajev's method (Priklad. Mat. Mech. 9, 3, (1945); ibid. 12, 1, (1948)) sufficient stability conditions for the trivial solution are established by aid of Liapunov's direct method.

Reviewed 4/1957
 Here the system of the equations $(dx_i/dt) = \sum_{j=1}^n p_{ij}(t)x_j$ with $i = 1, \dots, n$ of a disturbing motion is investigated. Here $V(t, x_1, \dots, x_n)$ $= \sum_{i,j} a_{ij}(t)x_i x_j$ ($a_{ii} = a_{jj}$) denotes a positively definite quadratic form which proves to be a LJAPUNOV function for the system of differential equations mentioned above. Derivation of the function V becomes quadratic and has a definite sign because of the ~~sign~~
 mentioned system of equations: $U(t, x_1, \dots, x_n) = dV/dt - \sum_{i,j} a_{ij}(t)x_i x_j$ ($a_{ii} = a_{jj}$). N.G.CETAEV, Prikl.Mat.i Mekh., 15, 1951, suggested the following evaluation for the function V : $V_0 \exp \int_{t_0}^t \lambda_1(t) dt \leq V \leq V_0 \exp \int_{t_0}^t \lambda_2(t) dt$. Here $\lambda_1(t)$ and $\lambda_2(t)$ denote the smallest and largest root respectively of the equation $\det \|a_{ij}(t) - \lambda a_{ij}(t)\| = 0$. With the help of the aforementioned evaluation it is possible to obtain an evaluation for the disturbances of the coordinates. Actually, the quadratic form V can be reduced to the following canonic form by unreal linear transformation: $V = \sum_{i=1}^n h_i y_i^2$. By insertion the following evaluation is then obtained:
 $V_0 \exp \int_{t_0}^t \lambda_1(t) dt \leq \sum_{i=1}^n h_i y_i^2 \leq V_0 \exp \int_{t_0}^t \lambda_2(t) dt$

If the transformation of V into the canonic form is orthogonal, the

Title : Determination of Density of a Liquid at High Pressures.

Orig Pub: Izmerit. tekhnika, 1956, No 4, 28-31

Abstract: A hydrostatic method is proposed for determination of the density of a liquid at high pressures, which is based on measurement of hydrostatic lifting force by means of a balance. An instrument is described which permits to measure the density by absolute and by relative methods. Mean quadratic error of 0.06% at pressures up to 4000 kg/cm². Maximum pressure at which the method is applicable is limited by viscosity (up to 200 poise, inclusive).

TITLE: The Adsorption of Polystyrene Latex on Cotton Tissue (Sorbsiya polistirol'nykh lateksov na khlopchatobumazhnoy tkani)

ANALOGICAL: Nauchnyye doklady vyschey shkoly, Khimiya i khimicheskaya tekhnologiya, 1958, Nr 5, pp. 460-464 (USSR)

ABSTRACT: The adsorption is regarded as heterocoagulation, i.e. coagulation of the particles on the adsorbant. The adsorption of three types of positively charged latex (polystyrene latex VA, polystyrene latex OOPKh and polymethyl acrylate OOPKh) and of two types of negatively charged latex (polystyrene latex with "Nekal" and a mixed polymer of butadiene with polystyrene and ammonium oleate SKS-30 as stabilizer were investigated. The influence of the latex concentration, the occurrence of a free stabilizer, the sign of the charge of the adsorbed particle and of the sorbent, as well as of the nature of the particle from the disperse phase on the sorption were also investigated. The adsorption of the latex depends not only on the concentration but also to a high degree on the excess stabilizer.

Card 1/3

The Adsorption of Polystyrene Latex on Cotton Tissue 156-53-5-14, 52

which hampers the adsorption. In the case of a simultaneous effect of the two factors the adsorption isothermal lines reach a maximum as the sum of two curves which express the effect of the latex concentration (increase in adsorption) and of the excess stabilizer (decrease in adsorption). When a great excess stabilizer is lacking the adsorption isothermal lines take a course characteristic for typical adsorption processes. The adsorption shows the greatest effect for a σ of the latex of 46 to 64-65 erg/cm. Then the quantity σ is greater the adsorption increases; however, an unequal adsorption layer results, as the adsorption is accompanied by homocoagulation.

Positively charged latexes are adsorbed by cotton tissue without electrolyte addition, while negatively charged types are adsorbed almost not at all without electrolyte. The dispersion phase of the latex does not have any noticeable effect on the adsorption; however, it influences considerably the properties of the adsorption layers obtained. There are 5 figures, 2 tables, and 6 references, which are Soviet.

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 13, 1966, 11

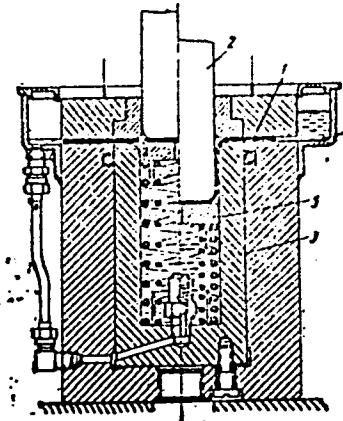

TOPIC TAGS: sheet metal, metal drawing, die

ABSTRACT: This Author's Certificate introduces a die for drawing sheet metal parts by using hydraulic pressure. The unit contains a punch, a fluid-filled female die and a clamping device. The unit is designed for hydrodynamic lubricating conditions and blocking off the section of the blank subject to damage. The die is equipped with an annular reservoir with a bottom flush with the female die surface. A knockout tool is placed in the working area with a diameter greater than that of the finished part. This knockout tool has apertures for transmitting fluid from the female die area to the annular reservoir, which are connected by a pipeline.

ABSTRACT: This Author's Certificate introduces a double action hydraulic press equipped with a hydraulic cylinder control system with distribution valves. These hydraulic cylinders transmit power both to the punch and the clamping jig. The unit is designed for transmitting pulsating movements with a given force and pulsation amplitude to the clamping device to provide deeper drawing. The hydraulic cylinder which transmits power to the clamping device has a hollow piston rod. This rod is mounted on the rod of a piston connected to the punch and is located in a hydraulic cylinder interacting with the distribution valves by means of an electrocontact pressure gauge in the hydraulic system and a terminal circuit breaker rigidly mounted on the press frame. The distribution valves switch fluid delivery between the cavities in the

COVERAGE: This is volume 3 of a 6-volume set of reports on atomic energy, presented by Soviet scientists at the Second International Conference on the Peaceful Uses of Atomic Energy, held in Geneva from September 1 to 13, 1958. Volume 3 consists of two parts. The first part, edited by A.I. Zubov, is devoted to geology, prospecting, concentration and processing of nuclear source material. The second part, edited by G.L. Zverev, includes 27 reports on metallurgy, metallography, processing technology of nuclear fuels and reactor metals, and neutron irradiation effects on metals. The titles of the individual papers in most cases correspond word for word with those in the official English language edition on the Conference proceedings. See SOV/2081 for the titles of the other volumes of the set.
